Proposed Methodologies for PC Quality Assessment

Introduction

Beyond The Window To The World (2D)

- Visual 3D Representations
- Voxels Instead Of Pixels
- 6 Degrees of Freedom

Introduction

Problem Description

- Point Cloud (PC) units contain 3D spatial information (eg. x, y, z) and color information (eg. R, G, B)
- Points (or voxels) are sparsely distributed in the 3D space
- New methods for automatic assessment the quality of 3D content are needed!

Introduction

Proposed Method

- Use color-based and geometry-based texture descriptors to estimate the quality of a degraded PC.

- The proposed objective full-reference PCQA method is based on the following steps:
  - 1. Voxelization Methodology
  - 2. Three color-based PC texture descriptors (adapted from 2D: LBP; novel: LLP and LCP) and one novel geometry-based PC texture descriptor are introduced, which can be used separately or jointly
  - 3. Compute distance between the texture descriptor histograms (reference vs test)
  - 4. Quality prediction model based on a regression algorithm

\begin{enumerate}

Você tem algum diagrama?

Ficaria legal uma figura

Introduction

Summary Of Contributions

- Parameterized voxelization method
- 4 novel PC texture descriptors based on local neighborhoods
- Statistical analysis of the proposed texture descriptors on different data-sets
- A model for PC quality assessment based on texture descriptors

Introduction

Overview

Capture

Typical setup: Array of RGB+D cameras

Overview

Capture

Eg. Kinect 2

Overview

Display

Typical display: HMD with environment and head-tracking sensors

Overview

Point Cloud Quality Assessment

- **Objective**: Predict the quality in an automatic way
- **Subjective**: Humans evaluate and rate the content

Feature	Subjective measure (SM)	Objective measure (OM)
Human involvement (observer)	Yes	No
Automatic	No	Yes
Mathematically defined algorithms	No	Yes
Expensive evaluation	Yes	No
Computational complexity	No	Yes
Inconvenient	Yes	No
Time consuming	Yes	No

Overview

PC Subjective Quality Assessment

- Very important for the development of Objective metrics
- Typically just extend the protocols for 2D image/video to PC
- ITU-R BT.500-14: "Methodologies for the subjective assessment of the quality of television images"
- Subjective evaluation can be passive (no user interaction) or active (with 6dof interaction)

| Level	Impairment	Quality
5	Imperceptible	Excellent
4	Perceptible, but not annoying	Good
3	Slightly annoying	Fair
2	Annoying	Poor
1	Very annoying	Bad

Overview *State of the Art in PCQA*

PC Subjective Quality Assessment

- PC subjective experiments can evaluate different types of PC degradation. Some work evaluate only geometry distortions, other just color distortions, while other jointly evaluate both.
  - Torlig et al., **A novel methodology for quality assessment of voxelized point clouds**, Applications of Digital Image Processing, International Society for Optics and Photonics, 2018.
  - Alexiou et al., **A comprehensive study of the rate-distortion performance in mpeg pointcloud compression**, Transactions on Signal and Information Processing (APSIPA), 2019.

Color And Geometry Textures ~~For Point Cloud Quality Assessment~~

Operators

Content

- Color and Geometry Texture Descriptors For PC
- Texture Histogram Distances
- Quality Prediction Model
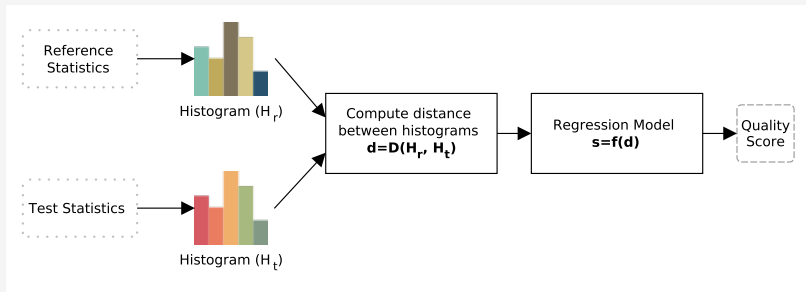

aqui você ainda está explicando o operador comum. Não é? Ou já seria a sua adaptação?

Color And Geometry Textures For Point Cloud Quality Assessment

Voxelization Pre-Processing

- PC points are sparsely distributed in the 3D space without volumetric meaning
- Voxelization convert point(s) to discrete volumetric units (voxels)
- One alternative to the voxels are meshes, but the mesh representation leads to higher computational cost, as capture devices capture RGB+Depth information, which are easily converted to PC, but have no point connectivity information needed by a mesh
- The definition of the voxel size is important, if too small, neighboring voxels may not touch each other, leaving visual "holes" between PC elements, while oversized voxels creates a swollen visual effect

Color And Geometry Textures For Point Cloud Quality Assessment

Voxelization With Different Voxel Sizes

Color And Geometry Textures For Point Cloud Quality Assessment

Voxelization Pre-Processing

- Considering a cube-shaped voxel, the following heuristic is defined to obtain a the voxel size, where ES is the edge size of the cube (voxel). Size^3 (ES):

$$\text{ES} = \frac{k}{S} \cdot \sum_{n=1}^{S} \left(\frac{1}{k_{nn}} \cdot \sum_{i=1}^{k_{nn}} \mathbf{d}\left(N_i(P_n), P_n \right) \right)$$

- S is the number of points of the PC
- k is a constant tested with different values (a multiplier of ES)
- P_n is the n-th point of a PC
- $N_i(P_n)$ gives the coordinates of the i-th nearest point to P_n
- $\mathbf{d}\left(P_a, P_b \right)$ gives the Euclidean distance of points P_a and P_b
- k_{nn} is the k-nearest neighbors and is set to 8 in this work.

# Color And Geometry Textures For Point Cloud Quality Assessment

Local Binary Patterns (LBP) for 2D images

o.k. entendi agora.

$$\text{LBP}_R^N(P_c) = \sum_{n=0}^{N-1} \theta(P_n - P_c) \cdot 2^n,$$

where

$$\theta(u) = \begin{cases} 1 & \text{if } u \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

195	153	200
200	128	33
18	81	201

Threshold →

1	1	1
1	128	0
0	0	1

- 2D images have pixels equally distributed in a dense 2D grid.

Color And Geometry Textures For Point Cloud Quality Assessment

Local Binary Patterns for PC (LBP)

- The LBP is a texture descriptor proposed by Ojala *et al.* to improve the accuracy of texture recognition tasks in 2D images. This work adapted the LBP to work with PCs

- PCs have no dense and uniform neighborhood to traverse, which is a problem, so the LBP for PCs traverse the neighbors considering the distance to a target point

Color And Geometry Textures For Point Cloud Quality Assessment

Local Luminance Patterns (LLP)

- A PC color-based texture descriptor based luminance patterns that are representative of intrinsic PC texture (RGB is converted to Y)
- Voxelization is used to improve the performance
- The texture descriptor label is calculated in an iterative way, for each neighbor:

$$(16 - bit)L = \begin{cases} L \vee (1 \ll \lfloor \frac{Y[i]-15}{15} \rfloor), & \text{if } 15 \leq Y[i] < 240; \\ L \vee (1 \ll 15), & \text{if } 240 \leq Y[i] \geq 255. \end{cases}$$

$$(12 - bit)L = \begin{cases} L \vee (1 \ll \lfloor \frac{Y[i]-20}{20} \rfloor), & \text{if } 20 \leq Y[i] < 240; \\ L \vee (1 \ll 11), & \text{if } 240 \leq Y[i] \geq 255. \end{cases}$$

~~Color And Geometry Textures For Point Cloud Quality Assessment~~

Local CIEDE2000 Patterns (LCP)

- CIELab color space - intended as a perceptually uniform space - has 3 channels: $L*$ for perceptual lightness, $a*$ is relative to green-red opponent colors, and $b*$ for the blue-yellow axis.

- CIELab color space is not really uniform - CIEDE2000 (CIELab Delta-E 2000) distance was introduced to fix CIELab perceptual non-linearities

- A numerical change corresponds to similar perceived change in color

[handwritten note: o formato está um bouco strauho é math ou texto?]

$$(8 - bit)L = \begin{cases} L \vee (1 \ll \lfloor \frac{C[i]-2.5}{2.5} \rfloor), & \text{if } 2.5 \leq C[i] < 20.0; \\ L \vee (1 \ll 7), & \text{if } C[i] \geq 20. \end{cases}$$

$$(12 - bit)L = \begin{cases} L \vee (1 \ll \lfloor \frac{C[i]-1.5}{1.5} \rfloor), & \text{if } 1.5 \leq C[i] < 18.0; \\ L \vee (1 \ll 11), & \text{if } C[i] \geq 18, \end{cases}$$

Color And Geometry Textures For Point Cloud Quality Assessment

Geometry-based Texture Descriptor

- In order to address PC geometric distortions, the geometry-based texture descriptor considers only the geometric information of each PC point (X, Y, Z)
- For this, normal vectors are calculated for all points, considering a PC local surface
- Since typical PC capture devices do not capture normal vectors (just RGB+D), the normal vectors need to be computed
- The normal vectors are normalized and set to a arbitrary point direction in order to remove duality (two normal vectors can correctly represent a surface)

Normal vector distances is defined as:

$$G = \sqrt{\sum_{d=1}^{3} (n_{t_d} - n_{i_d})^2}$$

Color And Geometry Textures For Point Cloud Quality Assessment

Geometry-based Texture Descriptor ~~Operator~~ (GEO)

Diagram of the geometric texture label computation, with the normal vectors represented as black lines:

Color And Geometry Textures For Point Cloud Quality Assessment

Texture Histogram Distances

- The histograms are obtained from the statistics of the labels produced by the texture descriptors, for reference and test PCs

- Different histogram distance measures were evaluated, namely: Bray-Curtis, Canberra, Chebyshev, City Block, Cosine, Euclidean, Jensen-Shannon, Wasserstein and Energy.
Histogram of labels (h_i)
Histogram of labels (h_r)

Color And Geometry Textures For Point Cloud Quality Assessment

PC Quality Prediction Modeling

- Quality predition model based on a regression method

- The regression algorithm takes as input the distance $\mathbf{D}$ of the histograms and maps it into an objective (predicted) quality score using subjective scores as ground-truth values

- Different regression models were evaluated: Extra Trees, Gradient Boosting, Random Forest and the Logistic function

Results and Comparisons

(handwritten annotations: "Experimental")

Experimental Setup :

We used the following data-sets, named D1 to D4 and subjective scores as follows:

- D1: Torlig 2018 [a]
- D2: Cruz 2019 [b]
- D3: Alexiou 2019 [c]
- D4: Stuart 2020 [d]

---

[a] A novel methodology for quality assessment of voxelized point clouds
[b] Point cloud quality evaluation: Towards a definition for test conditions
[c] A comprehensive study of the rate-distortion performance in mpeg pointcloud compression
[d] Quality evaluation of static point clouds encoded using MPEG codecs

Results and Comparisons ; Set up.

Experimental Setup

We opted to use the MPEG-released PC metrics plus PointSSIM and PCQM as benchmark. The MPEG metrics are the following:

po2point$_{MSE}$	PSNR-po2point$_{MSE}$	po2point$_{Haus}$	PSNR-po2point$_{Haus}$
Color-YCbCr$_{MSE}$	PSNR-Color-YCbCr$_{MSE}$	Color-YCbCr$_{Haus}$	PSNR-Color-YCbCr$_{Haus}$
po2plane$_{MSE}$	PSNR-po2plane$_{MSE}$	po2plane$_{Hausdorff}$	PSNR-po2plane$_{Haus}$

Results and Comparisons Conclusions :

LBP analysis

- Highly influenced by the voxelization
- k voxelization parameter between 2 and 6 are best
- Canberra and Jensen-Shannon distances are best performing distances
- Neighborhood size does not influence much for D1, D2 and D3, for D4 6 neighbors perform a bit better.
- PCC performance peaks at 0.877, 0.878 and 0.907 in D1, D2 and D3 respectively, while in D4, LBP PCC peaks at 0.724

Results and Comparisons

LLP analysis

- 16-bit and 12-bit tested
- The Euclidean best for the 16-bits variant. Euclidean, Jensen-Shannon and Chebyshev alternating best performance for 12-bits version
- 'k' best between 4.5 and 7.5 for the 16-bits version, not clear among all datasets for the 12-bits
- 16-bits peaks of PCC: 0.880, 0.839, 0.870 and 0.728; the 12 bits version peaked at 0.834, 0.820, 0.884 and 0.762

Results and Comparisons

LCP analysis

- 12 bits and a 8 bits variations
- Voxelization improves performance, but not homogeneously across data-sets
- Jensen-Shannon is best for D1, D2 and D3, but not by wide margin; for D4 Energy is best
- LCP 8-bits is slightly better than the 12 bits
- 12 neighbors slightly better performance to both variants
- LCP 12-bits has PCC peak values of 0.802, 0.780, 0.881 and 0.660, while the LCP 8 bits PCC peaked at 0.880, 0.775, 0.912 and 0.660

Results and Comparisons

GEO analysis

- 16-bit
- Voxelization degrades the performance in most scenarios; D4 is exception
- Voxelization is not suitable for the geometry-based texture descriptor
- Best histogram distance is the Jensen-Shannon
- PCC peaked at 0.777, 0.731, 0.814 and 0.713
- Neighborhood size does not influence so much

Results and Comparisons

Use of two or more descriptors for quality assessment

- Color and geometry texture descriptors alone, can not capture all types of distortions in a PC

- The proposed framework allows the use of two or more descriptors to predict PC quality

- The histogram distances can be combined and then used as input to the regressor
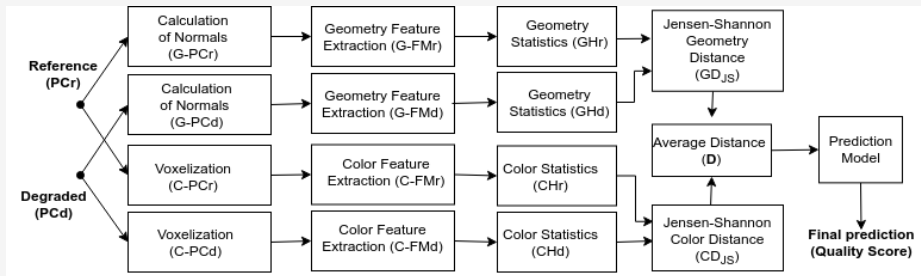

Results and Comparisons

Selected descriptors for joint use

- Geometry-based descriptor (GEO) fixed with 6 neighbors, no voxelization, Jensen-Shannon distance
- LBP+GEO, LBP with 8 neighbors, $k = 1.6$, Jensen-Shannon
- LLP+GEO, LLP 12-bits, with 8 neighbors, $k = 2.0$, Euclidean
- LCP+GEO, LCP 8-bits, with 12 neighbors, $k = 6.0$, Jensen-Shannon

Results and Comparisons

Conclusions

- Relevance of the voxelization process for color-based texture descriptors
- Different types of rendering techniques lead to certain uncertainly to the voxelization procedure
- Color-based texture descriptors perform better than the geometry-based texture descriptors independently
- The Jensen-Shannon distance presented the best overall correlation results, but not by wide margin
- The LCP needs less bits than LLP for a good performance
- Joint use of LCP and the geometry-based outperformed all other texture descriptors independently evaluated
- Descriptors are scale and rotational invariant
- The MPEG metrics seem to work better when the content is degraded with the MPEG PC encoders, with test conditions that degrade geometry and color with analogous intensity
- Overall, the proposed PC quality assessment metric framework proposed by this work outperforms all other metrics

Future Work

- Adaptive voxel size selection *;*
- Optimization of current texture descriptor through a ~~profound~~ *detailed* statistical analysis of the available PC content *。*
- ~~A~~ No-Reference ~~version~~ *PCQA method that* ~~using~~ *es* the histogram distances as input to a data-driven quality assessment model *.*
